The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC cliponucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence complementary to a CC oligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide comprises a 1 least 15 nucleotides and the combination of CC the 5'-end sequence', 3'-end sequence is selected from those defined in CC in gene therapy. The primers set useful for synthesising polynucleotides, CC oparticularly full-length cDNAs. The primers are useful for synthesising polynucleotides, CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs and methods. AAH03166 to AAH13628 and

The polypeptides can be expressed by standard recombinant methodology. The DIO-1 polypeptides, agonists and antagonists are used as a medicament for treating disease characterized by an alteration in cell death or by hyperproliferation, e.g. cancer, autoimmune diseases, diabetes, rheumatoid arthritis, beni

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Align seg 1/1 to: AAW61369
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide comprises rat 5-oxoprolinase, an enzyme that catalyses the ATP dependent cleavage of 5-oxoproline to L-glutamate in the metabolism of glutathione. The amino acid sequence is deduced from a cDNA sequence (see AAV28112) derived from overlapping clones from a rat kidney cDNA library. The invention is directed toward isolated nucleic acid molecules encoding mammalian toward isolated nucleic acid molecules encoding mammalian comprolinase (mSOP). Deficiency of this enzyme is associated with 5-oxoprolinuria. Expression vectors and host cells comprising the nucleic acid molecules are provided, as well as methods of increasing (by gene therapy) or decreasing (e.g. using antisense or ribozyme molecules) the expression of mSOP in host cells. The invention also provides a method of screening a substance for its ability to modify mSOP function, and a method for isolating other mSOP molecules. DNA probes and primers, and antibodies specific for mSOP are provided, each of which can be used to detect the

Its amino acid sequence was deduced from a human frontal cortex cDNA clone (AAT67187). The effects of HD in a patient expressing huntingtin protein with an expanded polyglutamine tract can be ameliorated by increasing the amount of expressed HIPl in the brain using gene therapy approaches. Modified forms of HIPl which bind more effectively to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to Huntingtin Interacting Protein (HIP), that includes a death effector domain (DED), suggesting apototic function. Proteins with DED (referred as HIP-apoptosis modulating proteins) are useful for inducing apoptotic death in cells. The HIP is a logical target for therapy in Huntington's disease since it has a differential apoptotic activity, modulated by interaction with Huntingtin having normal and expanded repeats. HIP is also used as therapeutic agent to introduce apoptosis in cancer cells. Increasing expression of normal (non-expanded) Huntingtin or the HIP-apoptotic modulator-binding portion, a modified HIP-apoptotic modulator in which the DED has been deleted, is helpful for

Proteins with DED (referred as HIP-apoptosis modulating proteins) are useful for inducing apoptotic death in cells. The HIP is a logical target for therapy in Huntington's disease since it has a differential apoptotic activity, modulated by interaction with Huntingtin having normal and

gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAD07705-AAD07759 represent cDNAs corresponding to 19 human secreted protein genes, and AAE03392-AAE03346 represent the proteins they encode. AAE03347-AAE03375 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the
                                                       as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used i alleviating symptoms associated with the disorders mentioned about the contract of the contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecules encoding human secreted preventing, treating or ameliorating a disorder, e.                                                                                                                                                                                                                                                                                                                                   skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodles specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diamnoscasay or enzyme linked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 19 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                 in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal expression of the genes corresponding to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can also be used for gene therapy to control or treat genetic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence is encoded by an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treating or controlling a variety of human conditions. The secreted proteins may act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB;

W,

Antibodies specific for PRO polypep the growth of tumors in mammals, an polypeptide activity or expression PRO polypeptides, used to diagnose amammals, and to identify inhibitors expression and s of inhibit

226pp; English.

The present invention describes an antibody that binds to a human control of the protein (I) selected from: PRO381; PRO1295; PRO1410; PRO1755; PRO1780; PRO434; PRO1927; PRO3567; PRO1295; PRO1295; PRO1395; PRO1395; PRO13944; PRO4344; PRO4344; PRO4397; PRO4407; PRO1555; PRO1295; PRO1293; and PRO2262. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent invention for human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human protein sequences given in the exemplification of PRO polynucleotide and protein the present invention.

                                    AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORRX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antianaemic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID, AIDS; cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal hæmoglobinuria; burn; wound; pone damage; cartilage damage; antiinflammatory disease; coagulation;

```

This invention describes novel human nucleic acid (cDNA) sequences that are highly expressed in uterine tumour tissue and which have

cytostatic activity. (A) are used (i) for recombinant

anticancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Percent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAX59941-Y60328 represent protein fragments encoded by the human endometrium tumour cDNA library derived EST fragments represented in AAX41981-Z42121.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This protection may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, infection or to identify H. pylori polypeptide binding compounds, is seful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from converlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant chomology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
